

## **Lab Manual**

**Course Title : Design and Analysis of Algorithms**

## Week 10:

- I. Given a list of activities with their starting time and finishing time. Your goal is to select maximum number of activities that can be performed by a single person such that selected activities must be non-conflicting. Any activity is said to be non-conflicting if starting time of an activity is greater than or equal to the finishing time of the other activity. Assume that a person can only work on a single activity at a time.

### Input Format:

First line of input will take number of activities N.

Second line will take N space-separated values defining starting time for all the N activities.

Third line of input will take N space-separated values defining finishing time for all the N activities.

### Output Format:

Output will be the number of non-conflicting activities and the list of selected activities.

### Sample I/O Problem I:

<b>Input:</b> 10 1 3 0 5 3 5 8 8 2 12 4 5 6 7 9 9 11 12 14 16	<b>Output:</b> No. of non-conflicting activities: 4 List of selected activities: 1, 4, 7, 10
--	--

- II. Given a long list of tasks. Each task takes specific time to accomplish it and each task has a deadline associated with it. You have to design an algorithm and implement it using a program to find maximum number of tasks that can be completed without crossing their deadlines and also find list of selected tasks.

### Input Format:

First line will give total number of tasks n.

Second line of input will give n space-separated elements of array representing time taken by each task.

Third line of input will give n space-separated elements of array representing deadline associated with each task.

### Output Format:

Output will be the total number of maximum tasks that can be completed.

### Sample I/O Problem II:

<b>Input:</b> 7 2 1 3 2 2 2 1 2 3 8 6 2 5 3	<b>Output:</b> Max number of tasks = 4 Selected task numbers : 1, 2, 3, 6
--	---

- III. Given an unsorted array of elements, design an algorithm and implement it using a program to find whether majority element exists or not. Also find median of the array. A majority element is an element that appears more than  $n/2$  times, where n is the size of array.

### Input Format:

First line of input will give size n of array.

Second line of input will take n space-separated elements of array.

**Output Format:**

First line of output will be '**yes**' if majority element exists, otherwise print '**no**'.

Second line of output will print median of the array.

**Sample I/O Problem III:**

<b>Input:</b> 9 4 4 2 3 2 2 3 2 2	<b>Output:</b> yes 2
---	----------------------------
